

Qld company to provide clean energy to China

April 26, 2007 02:52pm

Article from: AAP

PULSE Energy today signed a \$312 million agreement with the Chongqing Coal Group to build and jointly own and operate clean energy power plants in China.

The agreement involves the development of four 60-megawatt power stations at coal mine sites in Chongqing.

The power stations will use technology developed by the CSIRO to burn low concentration vent air methane to produce clean energy.

Pulse Energy business director Damien Weis said the deal provided the company with further growth opportunities.

"We are in a great position to capitalise on the enormous clean energy opportunities in China," Mr Weis said.

"The Chinese government has introduced legislation that requires power grid operators to purchase electricity generated by approved clean energy facilities."

Mr Weis was joined by delegates from the Chongqing Coal Group and Queensland Premier Peter Beattie at the signing of the agreement at Parliament House in Brisbane today.

Mr Beattie said the deal was not only good news for Queensland's booming economy, but represented a significant technological milestone which reinforced the state's position as a world supplier of renewable energy infrastructure.
